

Create a URL Redirect in an Email Campaign.

We use URL redirects to take users to something other than a landing page, like another website or PDF.

- 1: Create a new page in your content tree by clicking on the plus sign at the top of the page.
- 2: Select “ATLAS-Content” from the page type options list.
- 3: On the page that follows—press the green “continue” button at the top of the page.
- 4: Title your page “URL Redirect” and press save.
- 5: Immediately use the properties tab to navigate to the page called “navigation” from the dropdown.
- 6: Uncheck both boxes at the top of the page for “show in navigation” and “show in site map” , we don’t need this page showing anywhere. Press save at the top of the page.

7: After saving, select the option “URL Re-Direct” and put your URL that you would like to redirect to in the field.

8: Press save at the top of the page and your page will now redirect.

9: To get the URL of your page to put it into the email campaign. Go to the general tab (under the same dropdown that Navigation was under) and copy the “Live URL” from this page to use.
