

## Blog Update: Engage Blog and Connect Blog Differentiation

Due to the way blog images are handled in your Engage website versus blogs in the Connect portal, we needed to create a way for a user to distinguish between which the blog is for. When you are in the Engage website, traditionally you have used the **Title Image** field to display a thumbnail for the blog feed. However, in the Connect portal—you use the **Teaser Image** field to contribute it.

Since both the Connect and Engage blog use the page type, we created a new dropdown field that will allow you to select which blog you are contributing to.

After selecting the correct blog type, the form fields will reveal the Title Image field if the public blog is selected, or keep it hidden if the portal blog is selected.

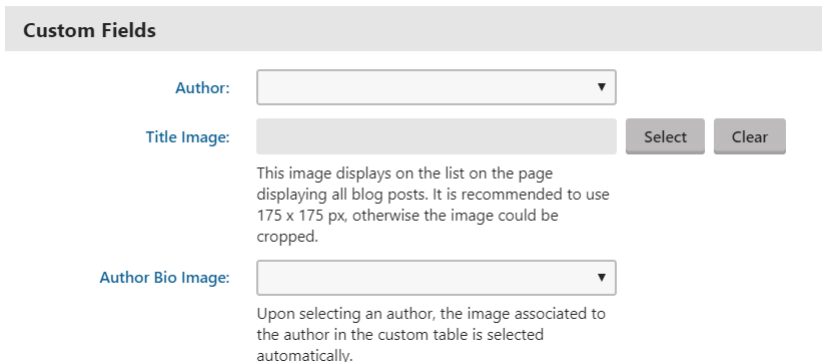

*Note: You should continue to contribute blogs in their normal folders, (Connect blog under the portal folder). Using the dropdown will not sort them automatically to their correct folders.*

The screenshot shows a form interface with a top navigation bar containing buttons for 'Save', 'Save and create another', and 'Spell check'. Below this is a rich text editor toolbar with icons for source, undo, redo, bold, italic, underline, text color, styles, bulleted list, numbered list, link, unlink, image, table, code, and fullscreen. The main form area is titled 'General' and contains the following fields:

- Blog Type:** A dropdown menu currently showing 'Public Blog'.
- Post title\*:** A dropdown menu with 'Public Blog' selected and 'Portal Blog' as an alternative option.
- Blog Post Description:** An empty text input field.

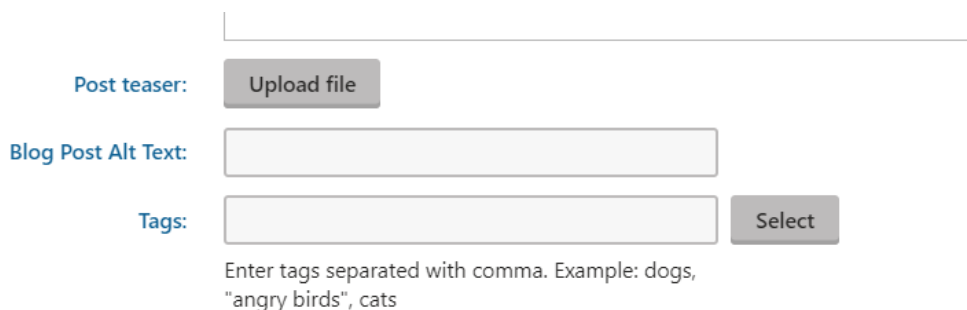

When the public blog (Engage website) is selected, the title image field will display for a user to contribute the thumbnail image for the blog feed. The field is located under “custom fields”.

The 'Custom Fields' section contains the following elements:

- Author:** A dropdown menu.
- Title Image:** A text input field with 'Select' and 'Clear' buttons. Below it is a note: "This image displays on the list on the page displaying all blog posts. It is recommended to use 175 x 175 px, otherwise the image could be cropped."
- Author Bio Image:** A dropdown menu. Below it is a note: "Upon selecting an author, the image associated to the author in the custom table is selected automatically."

When the portal blog (Connect portal) is selected, there will be no title image field. A user should use the post teaser field to contribute a thumbnail image for the portal blog feed:

The form shows the following fields and notes:

- Post teaser:** A text input field with an 'Upload file' button.
- Blog Post Alt Text:** A text input field.
- Tags:** A text input field with a 'Select' button. Below it is a note: "Enter tags separated with comma. Example: dogs, 'angry birds', cats"
